

How the whole system works

One platform for the entire guest lifecycle at a remote Alaska fishing lodge — from the first inquiry to the post-stay survey. Every screen, every phase, reads and writes **a single golden record per person**. This manual maps the modules, the data model, and how they connect. Nothing here is a silo.

Prepared for the build-out & migration teams

— THE BIG PICTURE

The system reads left-to-right as one guest's journey

The platform is organized as **six phases of a single guest lifecycle** — set up the inventory, sell it, prepare the guest, run the stay, follow up, and merge the history. Each phase stands on a shared layer of platform services (billing, comms, availability, storage, auth, multi-site tenancy), and each phase writes back to one **People & Trip record** at the center. The capability map below is the whole system on one page.

TALON LODGE PLATFORM • CAPABILITY MAP

Every module, arranged by the guest's journey

The system reads left to right as one guest lifecycle — from setting up inventory to the post-stay survey. Every phase writes to a single **People & Trip record**, and every phase stands on a shared layer of platform services. Nothing here is a silo.

Module / capability Lifecycle flow → Feeds the guest record External / embeddable

Guest lifecycle the five phases, in order — each column is one stage of a stay

The record everything writes to every phase above reads & writes here — one deduplicated person, their trips, and their history

Platform services shared foundations every module depends on

Capability map. Columns are the five stay phases in order; every card is a module. Below them, the golden record everything reads and writes; below that, the shared platform services every module depends on.

Four brands run on the one platform as tenants — **Talon Lodge, Bluff House, Alaska Luxury Lodge, and Magnus Adventures** — and each embeds a live availability widget into its own public website. A guest booking on any affiliated site can see and book across the affiliation.

The organizing principle is stated bluntly in the design docs: the master person record is **"the most critical element of the platform."** Everything funnels to the individual; the group is only *how* people book.

THE DATA MODEL

Everything hangs off one person

A human enters through one of several intake channels, is resolved to a single person master record, and then accumulates **groups, trips, per-trip profiles, and day-by-day asset assignments** over years of visits. History only accumulates — it is never overwritten. This is the schema spine.

The schema spine. Intake → matching → **person** (one master record) → group_persons / group → trip → trip_profiles (a snapshot per person, copied forward each visit) → assignments (person + asset + date) → assets. A booking agent's shared inbox lives on the group and is *never* merged into a person.

The design is deliberately **hybrid**: a strict relational spine (person, group, trip, assignments, matching, money) plus governed **JSON bags** — `assets.properties`, `trip_profiles.details`, `assignments.details` — so new offerings and custom fields need no migration. Rooms, boats, guides, massage, activities and breakfast are all just **assets**; anything scheduled is an **assignment**. Every table carries a public `ulid`, an `active` soft-delete flag (**no hard deletes, ever**), and audit columns.

— RELATIONSHIPS

The core relationships, with cardinality

The full column-level tables live in DB_SCHEMA.md. This is the relationship reference to read them against — the connections that carry the model.

FROM	TO	CARDINALITY	WHAT IT MEANS
person	group_persons → group	M : N	Members of a group are represented by a list of person objects. Each person object has a role (e.g. member, captain, etc.) and a level (e.g. 1, 2, 3, etc.) — role limits the level of the person.
group	trip	1 : 1	A group can have exactly one trip associated with it. The trip is a collection of visit objects. The group is the group of people who are on the trip.
trip	trip_profiles	1 : N	One trip can have many profiles. A profile is a person's flight, schedule, allergies, etc. of that trip. The profile is forward looking (last trip history).
trip	package	N : 1	A trip is associated with exactly one package. The package is a collection of visit objects (dates, times, etc.), but the package is not a trip.
package	package_assets → asset	M : N	A package can have many assets (rooms, etc.) and each asset belongs to exactly one package. Each asset has a rate.
asset_type	asset	1 : N	Room, Boat, etc. Each asset is associated with exactly one asset type.

— SCREEN BY SCREEN

Walking the guest lifecycle

Every screen below is a working prototype today (running on shared browser storage — the stand-in for the one production database). They are grouped by the phase of the stay they serve, and each notes who uses it and which entities it writes.

Before anything can be sold, staff define what the lodge offers — packages, rooms, activities, the crew and fleet, and the money rules. All of it becomes assets and packages.

TAVIN LEROY & SPA - PACKAGE MANAGER

Packages

Last package type can negotiate — its series, category, description, the **Includes / Does Not Include** lists, accommodations (with per-package rates, cross-listed affiliated rooms supported, add-ons, deposit & surcharges). Title, price range and date ranges are **dynamically** never stored. Fixed live by the booking engine.

Working copy is in this browser only. Rooms & activities are read live from RoomActivityManager. **Export** is used to export packages tables in production.

Package Management

ADMIN

Series, dates, per-person rates, includes/excludes, and the rooms & add-ons a package bundles. Title and price are computed; a publish guard blocks any package with an unpriced room.

```
writes packages · package_assets ·  
package_series
```

The screenshot shows a web application interface for 'Talon Lingo Platform - Asset Management'. The main heading is 'Rooms'. Below it, a paragraph explains that rooms are saved as assets (Type Room) with details in the propertyLine JSON. A warning message states: 'Working copy is in this browser only. To keep your work and carry it to the live system, Export the settings and load off the file - that JSON needs production, so you only enter this once.' On the right, there are two buttons: 'Export settings (browser.json)' and 'Export'. The left sidebar lists several rooms: 'Rooms (7)', 'Space 1' (Room, sleep 2 - 1 HR), 'Space 2' (Room, sleep 2 - 1 HR), 'Space House' (Custom, sleep 3 - 1 HR), 'Cedar 1' (Room, sleep 2 - 1 HR), 'Cedar 2' (Room, sleep 2 - 1 HR), 'Cedar House' (Custom, sleep 4 - 3 HR), and 'Bluff House' (Room, sleep 3 - 1 HR). The main content area shows the details for 'Space 1', including a title, description, and a list of items.

Rooms ADMIN

Cabins and suites with occupancy, media and Matterport tours. Each room is an asset the packages and room-assignment grid draw on.

```
writes assets (type Room)
```

Activities

Add and edit activity add-ons — descriptions, booking link, pricing, minimums, and the Talon arrival-day vs. sailing package day rates. Each is an asset type Activity with its details in the `propertyAssets.JSON`. The exact price depending you enter is presented verbatim in the structured price fields as you only enter this once.

Working copy is in this browser only. Export to carry the team to the live system. **Export** the settings and load off the live — that JSON needs production, so you only enter this once.

EDIT ACTIVITY

Select an activity, or click + New.

Activities ADMIN

Add-on adventures with per-day pricing, party-size caps, offering channel (portal / booking / both) and the days they run.

writes assets (*type Activity*)

Team & crew

The people and boats that create activity availability — guides (both what each can run and the booking order), message therapists, and boat crew. Captains & deckhands are assigned to boats but move freely between them. Each is an asset; capabilities and boat crew are `asset_links`. Read by the scheduling engine to work out what's bookable each day.

Working copy is in this browser only. Export to carry the team to the live system — that JSON needs the crew & capability tables.

1 Export (team.json) 1 Import

Guides Therapists Boats Captains Deckhands

Building order (top = booked first & what each can run. 3 guests / one activity per day)

1 **Ted Diering** LEAD BOOK SET **Freshwater Fishing (Boat/ATV/Plane)** **ATV Safety** **DELIVERY DAY** **Flip**

2 **Hidden Puckett** **Freshwater Fishing (Boat/ATV/Plane)** **ATV Safety** **Search & Lunch** **Whole Watching** **Hiking** **DELIVERY DAY** **ROSTER**

Only guides with a capability chip it can be assigned to that activity. Kayak & Lunch and Whale Watching are Ted only — the tightest bottlenecks. Delivery boat is the boat a guide runs against and not freshwater by boat/ATV — e.g., Ted takes the Flip (chip) into is captured, so booking that trip uses Ted and the Flip.

+ Add guide

Team & Fleet ADMIN

Guides, therapists, captains, deckhands and boats — with per-boat capacity and multi-boat captains. This roster is the schedulable resource pool.

0 guests | 0 groups on this package

No guests match. Add one with + Add guest, or load **Test data** for a roster.

Notes to Read's schema — guests are **persons** linked to this trip via **group_persons** + **trip_profiles**. The repeat count & years come from the **person's** stay history full trips that resulted in the same person via matching — here a distinct stay years. Listing here writes the trip profile, identity stays on the person.

trip_readlines is shared, year-stayed — each stay reads the guest's own **trip_profiles** with parties, address, listing, emergency contact, health answers, their **Right tags**, and whether a fishing license **seal** exists. Some record the Guest Portal writes, so the bar moves the moment a guest saves.

Booking Engine **GUEST**

The nine-step reservation flow: season & party → date → rooms → your details → guests → activities → review → deposit → confirm. A date is only offered when the free rooms can seat the party exactly.

writes reservation_request → person · group · trip

Guest List **LEAD GUEST**

The group lead completes the traveler roster at their own pace. Each name runs through matching and joins the group as a member — with their own portal invite.

writes guest_list_entries → group_persons

A magic-link opens the Guest Portal — each guest's self-service home for the trip. They complete their own profile, tell us their flights, upload their fishing license, and request the adventures and spa sessions they want.

SEND Viewing as Sportfishing · May 24 Younger Group guest Whole group · lead Production = a magic-link to one guest, no switcher.

Guest Portal

GUEST

A Viking-style tile home for the trip: Guest Details (per-person profile, allergies & medical, emergency contact, add-a-guest), Flights In & Out, Fishing License upload, Payments, Activity & Spa requests, Daily Agenda, and Photos & the catch to take home. Kids without their own email may share the group lead's — the same rule the booking flow enforces.

`writes` trip_profiles · assignments (requested) · stay_media

The operational core. Requests are approved, guests are assigned to rooms, boats and guides by day, and the day's run sheet, meals and catch are managed. Everything here is an assignment — person + asset + date.

TALON LODGE & SPA - ADMIN

Activity approvals

Every activity & spa request — from the reservation flow and the guest portal — lands here for review. Approve to confirm it, or decline. Each request carries a 24-hour review clock.

0 pending review

All Reservation Portal Refresh

No requests waiting.

Requests appear here when a guest picks activities in the [Reservation](#) flow or the [Guest Portal](#). Go make some, then Refresh.

Approving sets the request to **confirmed** and the guest sees it as **Scheduled** in their portal. Assigning the specific guide & boat happens on the [Scheduling](#) calendar. In production this queue also sends the admin notification and tracks the SLA server-side.

Approvals OPS

Every activity & spa request — from booking and the portal — lands here on a 24-hour clock. Approving assigns the guide / therapist / boat and confirms it; declining removes it.

writes assignment (*confirmed*)

TALON LODGE & SPA - SCHEDULING - PHASE 2

Availability & Scheduling

Pick a **package** — its real arrival-departure dates become the calendar — choose a **group**, then tick the **individual guests** on each booking. Every activity attaches to the person, not just the group. Bookings save against the actual date, so groups the same week compete for the same guides; the engine assigns the **best guide** first. Boats needed in **Boat Assignments** show on the master calendar, and a booked activity pulls that guest off the boat for the day.

Hidden Pocket can run freshwater fishing but has no delivery boat — excluded from freshwater by boat/ATV until assigned one in Team Management.

Package: **TRIP PARTY** Group: **NO MATCH FOUND / NEW**
 Sportfishing: **Mon May 24 - Sat** — Load Test data for groups: **W** — **2** — **4** [Clear all bookings](#)

Notes: Select a group above, then choose exactly who on each booking — every activity attaches to the individual.

Sportfishing **May 24 - May 26, 2022** 4 nights: 3 adventure days, arrival & departure are travel days

RESOURCE RESERVATION - THIS TRIP

What each guide, therapist & boat holds — by date, for the selected package

Resource	Mon May 24	Tue May 25	Wed May 26	Thu May 27	Fri May 28
Ted Deering - boat	---	---	---	---	---
Hidden Pocket	---	---	---	---	---
Day Spa - 2/day	---	---	---	---	---
Massage - guest & time	---	---	---	---	---
Saturday trips	---	---	---	---	---

Bookings are saved against the **real trip dates** and shared across every group that week — a guide holds **one activity per day** for up to 3 guests when the boat is taken. **Kayak & Whale** go dock (day-long); a guide who also captains a boat is not on days the boat is fishing.

MASTER RESOURCE CALENDAR - ALL PACKAGES / No double bookings - 3 dates across all trips

Scheduling OPS

The availability engine and master resource calendar. It honors capacity, the captain—who-also-guides conflict, and flags over-capacity rather than blocking it.

reads team · boats · bookings **writes** assignments

Boat assignments

Assign guests to boats for their sportfishing — pick the package date, then a group, then a boat. Each boat seats up to 6 **and capacity** from Team — a boat may be 4, 6 or 20 guests can share a boat, and if a group doesn't fully fit you choose which guests go on it and place the rest elsewhere. Any day a group has a scheduled activity, that activity takes priority and those guests drop off the boat for the day.

No groups loaded yet.

Load some sample groups to start assigning boats — or open the "Test" (beta) tool for the full season (15 groups).

[Load 6 sample groups](#)

Boat seat & Boat groups from: [Talon_SportFishing](#) Boat/crowd from Team, activities from: [Talon_BoatElog](#) & some home boats to: [Talon_BoatElog](#) and per-day activities to: [Talon_BoatElog](#) Load Test data first.

Boat Assignments OPS

A home boat per guest for the whole trip, plus per-day switching and a daily manifest. Cross-group fill and an "over by N" flag support big parties rotating boats.

writes assignments (*trip-wide + dated*)

Room Assignments

The reservation assigns the **roomid** to the group. Here you place each **individual guest** into one of the group's rooms. Their capacity is accepted and flagged (never blocked). Every assignment attaches to the guest, so it flows to the daily report and rooming list.

Package: May 24-May 28 - 4N - Standard Sportfishing Group: — Load Test data —

Meal & Beverage Orders OPS / GUEST

Per-guest nightly breakfast and beverage orders, rolled into a kitchen sheet and a boat-stocking list for the morning.

writes assignments (*Breakfast / Beverage*)

OPERATE - SPORTFISHING

Fish Processing

At the end of each fishing day, log the group's catch once. The engine yields the list weight per species (count * avg_weight * recovery%) with the day, and splits it into however many take-home shares. The group wants — **one named guest per share**. Each share's poundage lands on that guest's own record, so it rolls up per individual for the trip.

PERSON: May 24-May 28 - 4N - Standard Sportfishing GROUP: — no groups load Test data — PERSON DAY: Select a day...

Catch entry Guest summary Processing sheet

Pick a package, group, and fishing day to log the catch. No groups? Open Test data link to load the guest roster.

Maps to Andy's schema: fish_catch (trip_id, group, catch_date, species_id, count, avg_weight, recovery_pct) > fish_catch_split (catch_date, share_id, count, species_id, day) > fish_processing (trip_id, person_id, fish_weight (person/fish/share), fish_date, item_id, catch_date, share_id, fish_weight (trip_id, share_id, person_id, fish_weight, catch_date, item_id) > no fish count). Every share row references a person — the catch funnels to the individual.

Fish Processing OPS / CREW

Log the group's daily catch once; yield per species is computed and split into named take-home shares. Each share's poundage lands on that guest's own record.

writes assignments.details {*species, weight, count*}

Phase 5

Follow up

POST-STAY · AUTOMATED

After departure, post-stay communications send a native satisfaction survey (replacing SurveyMonkey). The score is appended to each guest's record and feeds their lifetime rollups — latest_survey_score, avg_survey_score — closing the loop back to the person.

WHY IT MATTERS

Because the survey score attaches to the **person**, not the trip alone, the next time that guest inquires — years later, in a different group — the office already sees their satisfaction history, past boats, guides and preferences. The follow-up phase is what makes the *next* first phase smarter.

HOW DATA FLOWS

One record, handed from module to module

The screens above aren't independent apps — they pass a single thread of data down the line. Three intake channels feed **one matching engine**; from the resolved person, the booking opens a group and trip; the portal and approvals fill the schedule; operations run off the assignments; and the survey rolls back onto the person.

CROSS-MODULE DEPENDENCIES ARE REAL

Because it's one dataset, changes ripple: **archive a boat or guide in Team** and Scheduling capacity drops that instant. A person who is **both captain and guide** is pulled from the guide pool on any day their boat is fishing. Over-capacity is **flagged, not blocked** — built for large groups rotating boats daily. These behaviors are defined in the prototypes and are the behavioral spec for the build.

— MASTER RECORD & MIGRATION

The individual is the record

Exactly **one master person per human**. A person is never re-created; every arrival is matched against who's already known. This is the engine that lets the platform replace three legacy systems — reservations, the profile/activity system, and SurveyMonkey — and merge them into one history. It was validated against four real 2026 exports totaling **2,706 rows**.

All intake — a website form, a booking, a lead-submitted guest list — produces a *candidate* that runs through the **same** `resolveGuest()` engine. None creates a person directly; the engine either links to an existing master record or creates a new one.

- **Tier 1 — exact email → auto-link.** **Guardrail:** if one email maps to two or more different people, it's a shared or agent inbox — **do not merge**. Store it on the group's booking-agent fields and flag for review.
- **Tier 2 — exact phone + nickname-equivalent name → auto-link.** The same phone with *different* names is a household, not one person — don't merge.

- **Tier 3 — name only → never auto-merge.** One contactful match auto-attaches; multiple go to a review queue; none stays unlinked, to be linked later. Ambiguous nicknames (Pat, Chris, Sam...) are never auto-canonicalized.
- **Never infer identity from a shared email domain, and never dedupe trips** — multiple bookings by one person are simply multiple trips.

MERGE IS REVERSIBLE, AND IDS ARE FOREVER

A **merge** combines two existing people under a survivor (chosen by most history → earliest first-seen → most complete → lower id). The survivor keeps its `id` and `ulid` for life; the loser's `ulid` becomes a **redirect** so old magic-links and invoices still resolve. Every merge stores full before-snapshots and the exact records it re-pointed, so it can be **undone precisely** — newest-first. Records that started pointing at the survivor *after* the merge stay put.

RUN IT MANY TIMES INTO STAGING, ONCE INTO PRODUCTION

Per the plan: build the importer as an **idempotent, repeatable migration** — re-runnable into staging until the mapping is right (upserts keyed on legacy source IDs, wrapped in transactions), which doubles as the **seed for dev and staging databases**. Then run it **once into production**. The recommendation is to build it as a Laravel Artisan command inside the API so it targets the real schema and can't drift; the matching / merge *rules* stay here in the design repo as the master spec.

— STACK & REPOSITORIES

Where the system gets built

The prototypes in this manual are single-file HTML on shared browser storage — the behavioral source of truth. The production build is a conventional three-tier app, split across the repositories below.

BUILD · TEAM ACCESS

stellainternational/talon-app2026-ui

Angular 20 + Angular Material on the licensed Daxa admin theme. The staff console and the guest portal front end.

BUILD · TEAM ACCESS

stellainternational/talon-app2026-api

Laravel back end on Aurora MySQL. Models, migrations, the availability engine, and the data-import migration.

MASTER DOCUMENTATION

pyounger/talon-lodge-design

This manual, all 37 prototypes, the schema docs, and the matching / merge rules. The blueprint the build is measured against.

DATABASE

Aurora MySQL 8 · InnoDB · Laravel migrations · soft-delete everywhere

BACK END

Laravel (PHP 8.2+) · Eloquent · the import migration lives here

FRONT END

Angular 20 + Material · Daxa theme · rebrand via Sass, no custom CSS

SERVICES

S3 storage · **SES** magic-link · **Stripe** billing · multi-site tenancy

ONE NOTE FOR THE BUILD TEAM

An older `SERVER_SETUP.md` in the design repo describes a **superseded** Postgres + Node + React stack — the project pivoted to **MySQL + Laravel + Angular**. Treat that file as infra/ops reference only (private-subnet DB, presigned S3, SES magic-link, snapshot-before-migrate all still apply); the current app stack is the one above. And on the Daxa theme: pin exact versions / commit a lockfile and install with `--legacy-peer-deps`, or `ng serve` throws ~90 type errors that aren't your code.

— SCREEN INDEX

Every tool in the set

The complete prototype inventory in the design repo. Thirteen are wired into a one-origin test hub that shares a single dataset, so integration behavior can be tested across tools.

`booking-engine` 9-step guest reservation flow

`guest-portal` Guest self-service trip home

`package-guest-list` Lead completes the roster

`packages-admin` Packages, series, rates, publish guard

`rooms-admin` Cabins & suites

`activities-admin` Add-on adventures & pricing

team-admin	Guides, crew, boats, capacity
rooms/asset-catalog	Master asset catalog / seeder
massage-menu · massage-schedule	Spa catalog & slotting
menu · beverage · cocktail-admin	Breakfast & drinks catalog
fish-types	Species & recovery-% catalog
settings-admin	Deposit, fees, policy
vendors-admin · access-admin	Pilots, providers, staff access
scheduling-demo · plan	Availability engine + calendar
approvals	Activity & spa request queue
boat-assignments	Home boat + daily switching

room-assignments	Guests → rooms
daily-report	Per-date run sheet by person
daily-display · signature-display	Guest-facing boards
meal-orders	Breakfast & beverage orders
fish-processing	Catch yield & take-home split
flight-info	Arrival / departure legs
guest-photos	Person-keyed recognition photos
record-management	Master record, matching & merge
module-map · db-erd	The two master diagrams above
test-hub · test-data · test-guide	One-origin harness & scripts

Talon Lodge Platform – Field Manual. Compiled from the talon-lodge-design documentation set: DB_SCHEMA.md, DATABASE_DESIGN.md, module-map.html, db-erd.html, RECORD_MANAGEMENT.md, MATCHING_RULES.md, MERGE_RULES.md, and the working prototypes.

Screens are live renders of the current prototypes. Where the docs describe production behavior not yet built in Angular/Laravel, the prototype is the behavioral source of truth.
